

Installation

SeoTools is compatible with Windows XP/7/8/10 and Excel 2007/2010/2013/+.

Step1: Make sure the full version of .Net is installed

SeoTools requires that the full version of .Net to be installed on your computer.

This is normally already installed on your computer by Windows Update.

Validate your .Net installation:

<http://links.seotoolsforexcel.com/dotnetvalidate>

You can find the latest version of .Net:

<http://links.seotoolsforexcel.com/dotnet>

Restart your computer after installing .Net.

Step2: Figure out what version of SeoTools to use and unzip

Your Excel version is either in 32bit or 64bit. You need to use the corresponding SeoTools version for the add-in to work.

Figure out what version of Excel you're using:

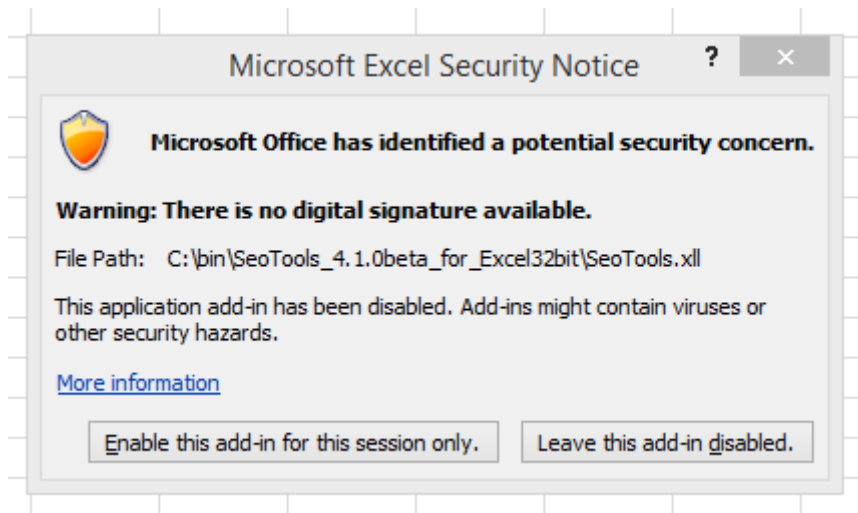

<http://links.seotoolsforexcel.com/excelversion>

Unzip the SeoTools_for_ExcelXbit.zip to a directory of your choice.

Step3: Open SeoTools.xll

Start using SeoTools by opening the SeoTools.xll in Excel. You can also drag & drop SeoTools.xll directly on the Excel spreadsheet you're working on

When opening SeoTools.xll you will get a "Security Notice":

Now you have all SeoTools functions in your Excel environment. In your Ribbon you should see a “SeoTools” tab. Note that you must perform these steps every time you open a Excel document where you want to use the SeoTools.
